I. SFR-BCR

Binary variables: $x_1, x_2, \ldots, x_n \in \{0,1\}$, and let $X := \sum_{i=1}^{n} x_i$, $2 \leq k \in \mathbb{N}$, $l = \lceil \log k \rceil$

A. SFR-BCR-1,2

We have the $l+1$ auxiliary variables $y_0, y_1, \ldots, y_{l-1}, z \in \{0,1\}$. (In the formulas, summations for $i, i' = 1, 2, \ldots, n$ and $j, j' = 0, 1, \ldots, l-1$ are understood.)

We have the function (See Observation 1. from [1])

eq:Ak

$$A_k(X, y, z) = X - (k - 2^l)z - (k+1)(1-z) - \sum_j 2^j y_j. \tag{1}$$

After substituting for X, and collecting the terms, the equation for SFR-BCR-1 becomes

eq:Ak1

$$A_k(X, y, z) = -(1+k) + \sum_i x_i - \sum_j 2^j y_j + (1+2^l)z. \tag{2}$$

Similarly for SFR-BCR-2 we have

eq:Ak2

$$A_{n-k}(n - X, y, z) = -(1-k) + \sum_i x_i - \sum_j 2^j y_j + (1+2^l)z. \tag{3}$$

For the two cases (top/bottom = SFR-BCR-1/SFR-BCR-2), by recognizing their similarities we can simplify the equation to

eq:Ak12

$$\left.\begin{array}{l} A_k(X, y, z) \\ A_{n-k}(n - X, y, z) \end{array}\right\} = -(1 \pm k) \pm \sum_i x_i - \sum_j 2^j y_j + (1+2^l)z. \tag{4}$$

Then the squares are

$$
\left.\begin{array}{l} A_k(X,y,z)^2 \\ A_{n-k}(n-X,y,z)^2 \end{array}\right\}
\begin{aligned}[t]
&= (1\pm k)^2 \mp 2(1\pm k)\sum_i x_i + 2(1\pm k)\sum_j 2^j y_j - 2(1\pm k)(1+2^l)z \\
&\quad + \sum_i \sum_{i'} x_i x_{i'} \mp 2\sum_i \sum_j 2^j x_i y_j \pm 2(1+2^l)\sum_i z x_i \\
&\quad + \sum_j \sum_{j'} 2^{j+j'} y_j y_{j'} - 2(1+2^l)\sum_j z 2^j y_j \\
&\quad + (1+2^l)^2 z^2.
\end{aligned}
\tag{5}
$$

eq:Ak12sq

Because $z \in \{0,1\}$, we have $z^2 = z$, so we can join the two terms,

$$
-2(1\pm k)(1+2^l)z + (1+2^l)^2 z^2 = (1+2^l)(2^l \mp 2k - 1)z, \tag{6}
$$

so we end up with

$$
\begin{aligned}
&\left.\begin{array}{l} A_k(X,y,z)^2 \\ A_{n-k}(n-X,y,z)^2 \end{array}\right\} = \\
&\underbrace{(1\pm k)^2}_{\alpha} + \underbrace{\mp 2(1\pm k)}_{\alpha^b}\sum_i x_i + \sum_j \underbrace{(1\pm k)2^{j+1}}_{\alpha^{b_{a,1}}} y_j + \underbrace{(1+2^l)(2^l \mp 2k - 1)}_{\alpha^{b_{a,2}}} z \\
&+ \underbrace{1}_{\alpha^{bb}} \sum_{i,i'} x_i x_{i'} + \sum_{i,j} \underbrace{\mp 2^{j+1}}_{\alpha^{bb_{a,1}}} x_i y_j + \underbrace{\pm 2(1+2^l)}_{\alpha^{bb_{a,2}}} \sum_i x_i z \\
&+ \sum_{j,j'} \underbrace{2^{j+j'}}_{\alpha^{b_a b_{a,1}}} y_j y_{j'} + \sum_j \underbrace{-(1+2^l)2^{j+1}}_{\alpha^{b_a b_{a,2}}} y_j z.
\end{aligned}
\tag{7}
$$

eq:alpha12

The coefficients are eq:BCR12alpha

$$\alpha = (1 \pm k)^2, \tag{8a}$$

$$\alpha^b = \mp 2(1 \pm k), \tag{8b}$$

$$\alpha^{b_{a,1}} = (1 \pm k)2^{j+1}, \tag{8c}$$

$$\alpha^{b_{a,2}} = (1 + 2^l)(2^l \mp 2k - 1), \tag{8d}$$

$$\alpha^{bb} = 1, \tag{8e}$$

$$\alpha^{bb_{a,1}} = \mp 2^{j+1}, \tag{8f}$$

$$\alpha^{bb_{a,2}} = \pm 2(1 + 2^l), \tag{8g}$$

$$\alpha^{b_a b_{a,1}} = 2^{j+j'}, \tag{8h}$$

$$\alpha^{b_a b_{a,2}} = -(1 + 2^l)2^{j+1}. \tag{8i}$$

Dictionary:
$l \mapsto m - 1$, ($l + 1 = m$ auxiliary variables),
$x_i \mapsto b_i$,
$y_j \mapsto b_{a_j}$, ($b_{\mathrm{a},j}$ would be a better choice, a is a label, j is an index, they should be on the same level. Also the indexing of the $\alpha^{\cdots}$ coefficients could be made more expressive.)
$z \mapsto b_{a_m}$, ($b_{\mathrm{a},m}$ would be better)
$k \mapsto c$.
Note that, in this case, the j indices of the auxiliary bits have to be shifted, since they are ranging from 1, not 0. (This is not the case in the next subsection.)

B. SFR-BCR-3,4

We have now the l auxiliary variables $y_1, y_2, \ldots, y_{l-1}, z \in \{0, 1\}$. (In the formulas, summations for $i, i' = 1, 2, \ldots, n$ and $j, j' = 1, 2, \ldots, l - 1$ are understood.)

We have the functions

eq:Akp

$$A'_k(X, y, z) = X - (k - 2^l)z - (k+1)(1-z) - \sum_j 2^j y_j. \tag{9}$$

Note that, compared to (1), the difference is only in the range of index j of the sum in the last term. For the two cases (top/bottom = SFR-BCR-3/SFR-BCR-4), after substituting and collecting the terms,

eq:Akp34

$$\left.\begin{array}{l} A'_k(X, y, z) \\ A'_{n-k}(n - X, y, z) \end{array}\right\} = -(1 \pm k) \pm \sum_i x_i - \sum_j 2^j y_j + (1 + 2^l)z. \tag{10}$$

(Again, although not written out explicitly, the difference is in the range of j of the summation, c.f., (4))

We can obtain the $\alpha^{\cdots}$ coefficients for BCR-3,4 from those of BCR-1,2. Instead of taking the squares, $A_k(X, y, z)^2$ and $A_{n-k}(n - X, y, z)^2$, for BCR-3,4 we have to take $\frac{1}{2}A'_k(X, y, z)\big(A'_k(X, y, z) - 1\big) = \frac{1}{2}\big(A'_k(X, y, z)^2 - A'_k(X, y, z)\big)$ and $\frac{1}{2}A'_{n-k}(n - X, y, z)\big(A'_{n-k}(n - X, y, z) - 1\big) = \frac{1}{2}\big(A'_{n-k}(n - X, y, z)^2 - A'_{n-k}(n - X, y, z)\big)$, so, to get the new $\alpha^{\cdots}$ coefficients, we have to substract the corresponding coefficients of $A'_k(X, y, z)$ and $A'_{n-k}(n - X, y, z)$ (these can be read off from (10)) from the old ones (8), and divide by 2. (And not to forget that the summations for j run over a different range.)

eq:BCR34alpha

$$\alpha = \frac{1}{2}\Big((1 \pm k)^2 - -(1 \pm k)\Big) = \frac{1}{2}(k^2 \pm 3k + 2), \tag{11a}$$

$$\alpha^b = \frac{1}{2}\Big(\mp 2(1 \pm k) - \pm 1\Big) = -k \mp \frac{3}{2}, \tag{11b}$$

$$\alpha^{b_{a,1}} = \frac{1}{2}\Big((1 \pm k)2^{j+1} - -2^j\Big) = (3 \pm k)2^{j-1}, \tag{11c}$$

$$\alpha^{b_{a,2}} = \frac{1}{2}\Big((1 + 2^l)(2^l \mp 2k - 1) - (1 + 2^l)\Big) = (1 + 2^l)(2^{l-1} \mp k - 1), \tag{11d}$$

$$\alpha^{bb} = \frac{1}{2}\big(1\big) = \frac{1}{2}, \tag{11e}$$

$$\alpha^{bb_{a,1}} = \frac{1}{2}\big(\mp 2^{j+1}\big) = \mp 2^j, \tag{11f}$$

$$\alpha^{bb_{a,2}} = \frac{1}{2}\big(\pm 2(1 + 2^l)\big) = \pm(1 + 2^l), \tag{11g}$$

$$\alpha^{b_a b_{a,1}} = \frac{1}{2}\big(2^{j+j'}\big) = 2^{j+j'-1}, \tag{11h}$$

$$\alpha^{b_a b_{a,2}} = \frac{1}{2}\big(-(1 + 2^l)2^{j+1}\big) = -(1 + 2^l)2^j. \tag{11i}$$

Dictionary:

$l \mapsto m$, ($l = m$ auxiliary variables),

$x_i \mapsto b_i$,

$y_j \mapsto b_{a_j}$, ($b_{\mathrm{a},j}$ would be a better choice, a is a label, j is an index, they should be on the same level. Also the indexing of the $\alpha^{\cdots}$ coefficients could be made more expressive.)

$z \mapsto b_{a_m}$, ($b_{\mathrm{a},m}$ would be better)

$k \mapsto c$.

C. SFR-BCR-5

We begin with the quadratization of f:

(Theorem 6, [2])

$$g(x,y,z) = \sum_{i=0}^{l-1}\sum_{j=0}^{l-1} r(il+j)y_i z_j + 2M\left(1-\sum_{i=0}^{l-1} y_i\right)^2 + 2M\left(1-\sum_{j=0}^{l-1} z_j\right)^2 + 2M\left(|x| - \left(l\sum_{i=0}^{l-1} iy_i + \sum_{j=0}^{l-1} jz_j\right)\right)^2 \tag{12}$$

After rearranging and substituting $|x| = \sum_i x_i$ we get the equation

$$g(x,y,z) = \sum_{i,j=1}^{l-1} r((i-1)l+(j-1))y_i z_j + 2M\left[\left(1-\sum_{i=0}^{l-1} y_i\right)^2 + \left(1-\sum_{j=0}^{l-1} z_j\right)^2 + \left(\sum_i x_i - \left(l\sum_{i=1}^{l-1}(i-1)y_i + \sum_{j=1}^{l-1}(j-1)z_j\right)\right)^2\right] \tag{13}$$

Dictionary:

$l \mapsto m+1$,

$x_i \mapsto b_i$,

$y_j \mapsto b_{a_j}$,

$z \mapsto b_{a_{c+i}}$,

$\lambda \mapsto 2M$

$r(x) \mapsto f(x)$

D. SFR-BCR-6

Lets start with the following quadratization of f:

(Theorem 10, [1])

$$
\begin{aligned}
g(x,y,z) = & \sum_{i=1}^{l-1}\sum_{j=1}^{l-1} a_{i,j}\cdot y_i \cdot z_j + M + M\cdot(X-Y-1)\cdot(X-Y+1) \\
& + M\cdot\sum_{i=1}^{l-2}(1-y_i)\cdot y_{i+1} + M\cdot\sum_{j=1}^{l-2}(1-z_j)\cdot z_{j+1}
\end{aligned} \tag{14}
$$

After factoring out M

$$
\begin{aligned}
g(x,y,z) = & \sum_{i,j}^{l-1} a_{ij}y_iz_j + M\Big(1 + \Big((X-Y-1)(X-Y+1)\Big) \\
& + \sum_{i=1}^{l-2}(1-y_i)y_{i+1} + \sum_{j=1}^{l-2}(1-z_j)z_{j+1}\Big)
\end{aligned} \tag{15}
$$

Substituting for X, Y, and m using $\sum_i w_i x_i$, $l\left(\sum_{j=1}^{l-1} y_j\right) + \sum_{j=1}^{l-1} z_j$, and $l-1$, respectively, we get

$$
\begin{aligned}
g(x,y,z) = & \sum_{i,j}^{m} a_{ij}y_iz_j + M\Big[1 + \Big(\sum_i w_ix_i - (m-1)\sum_{j=1}^{m} y_j + \sum_{j=1}^{m} z_j - 1\Big) \\
& \Big(\sum_i w_ix_i - (m-1)\sum_{j=1}^{m} y_j + \sum_{j=1}^{m} z_j + 1\Big) + \sum_{i=1}^{m-1}(1-y_i)y_{i+1} + \sum_{j=1}^{m-1}(1-z_j)z_{j+1}\Big]
\end{aligned} \tag{16}
$$

Dictionary:

$l \mapsto m+1$,

$x_i \mapsto b_i$,

$y_j \mapsto b_{a_j}$,

$z \mapsto b_{a_{c+i}}$,

$\lambda \mapsto M$

E. SFR-ABCG-2

We begin with the following representation of the parity function. (Theorem 4.6, [3])

$$\prod(x) = \sum_{j=1}^{n} x_j + 2\sum_{i=1}^{n-1}(-1)^{i-1}\left[i - \sum_{j=1}^{n} x_j\right]^{-} \tag{17}$$

Adding $E(l) = l(l-1) + 2\sum_{i=1}^{n-1}[i-l]^{-}$ where $l = \sum_{j=1}^{n} x_j$, we get the quadratization

$$\begin{aligned} g(x,y) &= 2\sum_{i<j} x_i x_j + \sum_{j=1}^{n} x_j + 4\sum_{\substack{i=1:\\ i\ odd}}^{n-1} y_i\Big(i - \sum_{j=1}^{n} x_j\Big) \\ &= \sum_{i} x_i + 2\sum_{ij} x_i x_j + 4\sum_{2i-1}^{n-1} y_i\Big(2i-1-\sum_{j} x_j\Big) \end{aligned} \tag{18}$$

Dictionary:

$x_{i,j} \mapsto b_{i,j}$,

$y_i \mapsto b_{a_i}$

F. SFR-ABCG-3

We begin with the complement of the previous function from SFR-ABCG-2: (Theorem 4.6, [3])

$$\overline{\prod}(x) = 1 - \sum_{j=1}^{n} x_j + 2\sum_{i=1}^{n-1}(-1)^{i}\left[i - \sum_{j=1}^{n} x_j\right]^{-} \tag{19}$$

Adding $E(l) = l(l-1) + 2\sum_{i=1}^{n-1}[i-l]^{-}$ where $l = \sum_{j=1}^{n} x_j$, we get the quadratization

$$\begin{aligned} g(x,y)' &= 1 + 2\sum_{i<j} x_i x_j - \sum_{i}^{n} x_i + 4\sum_{\substack{i=2:\\ i\ even}}^{n-1} y_i\Big(i - \sum_{j=1}^{n} x_j\Big) \\ &= 1 + 2\sum_{ij} x_i x_j - \sum_{i} x_i + 4\sum_{2i}^{n-1} y_i\Big(i - \sum_{j} x_j\Big) \end{aligned} \tag{20}$$

Dictionary:

$x_{i,j} \mapsto b_{i,j}$,

$y_i \mapsto b_{a_i}$

G. SFR-BCR-7

Beginning with the quadratization of f:
(Theorem 9, [2])

$$
\begin{aligned}
g(x,y,z) = &\sum_{i=0}^{l-1}\sum_{j=0}^{l-1} r(il+j)y_i z_j + 2M\left(1-\sum_{i=0}^{l-1} y_i\right)^2 + 2M\left(1-\sum_{j=0}^{l-1} z_j\right)^2 \\
&+ 2M\left(|x| - \left(l\sum_{i=0}^{l-1} iy_i + \sum_{j=0}^{l-1} jz_j\right)\right)^2
\end{aligned} \tag{21}
$$

Finally, we end with the equation

$$
g(x,y) = 1 + 2\sum_{ij} x_i x_j - \sum_i x_i + 4\sum_{2i}^{n-1} y_i\Big(i - \sum_j x_j\Big) \tag{22}
$$

H. SFR-BCR-8

Take the quadratization of the at least k-out-of-n function $f_{\geq k}$:
(Theorem 8, [2])

$$
G_k(x,y,z) = \frac{1}{2}A_k(x,y,z)(A_k(x,y,z)-1) + (1-z) \tag{23}
$$

With our results from SFR-BCR-8 and adding $(1+z)$ we get

$$
\begin{aligned}
G_k(x,y,z) &= \underbrace{\frac{1}{2}(k^2+3k+4)}_{\alpha} + \underbrace{-\frac{1}{2}(2k+3)}_{\alpha^b}\sum_i x_i + \sum_j \underbrace{(k+2)2^{j-1}}_{\alpha^{b_{a,1}}} y_j + \underbrace{\frac{1}{2}((1+2^l)(2^l-2k-2)-2)}_{\alpha^{b_{a,2}}} z \\
&+ \underbrace{\frac{1}{2}}_{\alpha^{bb}} \sum_{i,i'} x_i x_{i'} + \sum_{i,j} \underbrace{-2^j}_{\alpha^{bb_{a,1}}} x_i y_j + \underbrace{(1+2^l)}_{\alpha^{bb_{a,2}}} \sum_i x_i z \\
&+ \sum_{j,j'} \underbrace{2^{j+j'-1}}_{\alpha^{b_a b_{a,1}}} y_j y_{j'} + \sum_j \underbrace{-(1+2^l)2^j}_{\alpha^{b_a b_{a,2}}} y_j z
\end{aligned}
\tag{24}
$$

The coefficients are

$$\alpha = \frac{1}{2}(k^2+3k+4), \tag{25a}$$

$$\alpha^b = -\frac{1}{2}(2k+3), \tag{25b}$$

$$\alpha^{b_{a,1}} = (k+2)2^{j-1}, \tag{25c}$$

$$\alpha^{b_{a,2}} = \frac{1}{2}((1+2^l)(2^l-2k-2)-2), \tag{25d}$$

$$\alpha^{bb} = \frac{1}{2}, \tag{25e}$$

$$\alpha^{bb_{a,1}} = -2^j, \tag{25f}$$

$$\alpha^{bb_{a,2}} = (1+2^l), \tag{25g}$$

$$\alpha^{b_a b_{a,1}} = 2^{j+j'-1}, \tag{25h}$$

$$\alpha^{b_a b_{a,2}} = -(1+2^l)2^j. \tag{25i}$$

Dictionary:

$l \mapsto m$,

$x_i \mapsto b_i$,

$y_j \mapsto b_{a_j}$,

$z \mapsto b_{a_m}$,

$k \mapsto c$.

I. SFR-BCR-9

We begin with the equation for the x-symmetric quadratization of $f_k(x)$ (Lemma 2 Eqn 7, [1])

$$G(X,y) = \alpha X^2 + X\left(\beta + \sum_{j=1}^{m}\gamma_j y_j\right) + \left[\sum_{1\le i<j\le m}\delta_{ij}y_iy_j + \sum_{j=1}^{m}\epsilon_j y_j + \phi\right] \tag{26}$$

Using the relationship $X = \sum_i^n x_i$ and rearranging, we get

$$\begin{aligned} G(X,y) &= \alpha\sum_{i,j}^{m}x_ix_j + \sum_{i}^{m}x_i\left(\beta + \sum_{j=1}^{m}\gamma_j y_j\right) + \left[\sum_{1\le i<j\le m}\delta_{ij}y_iy_j + \sum_{j=1}^{m}\epsilon_j y_j + \phi\right] \\ &= \alpha\sum_{i,j}^{m}x_ix_j + \beta\sum_{i}^{m}x_i + \sum_{1,j=1}^{m}\gamma_j x_i y_j + \sum_{ij}^{m}\delta_{ij}y_iy_j + \sum_{j=1}^{m}\epsilon_j y_j + \phi \end{aligned} \tag{27}$$

Dictionary:

$x_i \mapsto b_i$,

$y_j \mapsto b_{a_j}$
